

Reading guide

Gray bar: 95% interval of the scope-matched random-pool null. Black dot: observed effect. Ring: effect outside the band.
 Diamond (panel a): approximate minimum detectable effect (80% power, normal approximation; open = exceeds OCG ≤ 1).
 The simulated power in Fig. 4c is the primary basis for detectability; the diamonds are a rough guide only.

20 of 21 observed effects lie inside the 95% null band. Inside the band means 'undetermined', not 'absent'.
 Outside the band (ring): panel b: Original four lines (service share), betweenness (distance), effect -0.200 (below the band)
 Eigenvector (exploratory, outside the confirmatory family) is omitted here.
